

Lab 6
Level 0

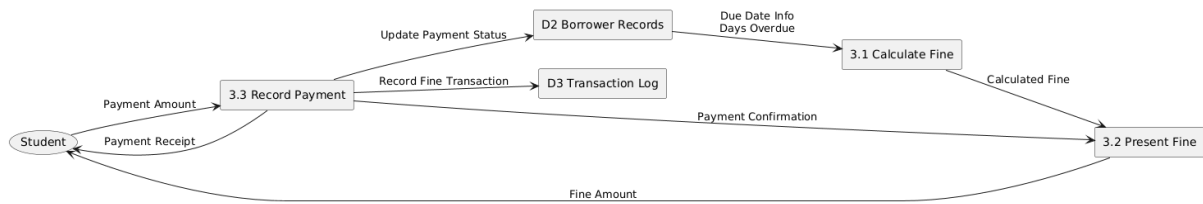

Description: The student submits the Book ID and, if necessary, the fine payment to the Return Book System. The system checks this information in the Library Database and validates the book and borrower details. If the information is correct, the system completes the return process, sends a return receipt to the student, sends a return confirmation to the Notification Service, and sends a shelf placement signal to the Shelf Mechanism. If there is an error, such as incorrect book information or missing payment, the system sends an error message or fine amount back to the student.

Level 1

Description: The process starts when the student submits the Book ID. The system validates the book by checking the book inventory. After the book is validated, the system checks the due date using the borrower records. If the book is overdue, the system calculates the fine amount and receives the payment confirmation from the student. Once the payment is confirmed, or if there is no fine, the system updates the inventory and records the return transaction. Finally, the system sends a notification and gives the return receipt to the student.

Level 2

Description: The process starts by checking the borrower records to get the due date information and the number of days overdue. The system calculates the fine based on this information and presents the fine amount to the student. The student then makes the payment. After receiving the payment amount, the system records the payment, updates the borrower's payment status, saves the fine transaction in the transaction log, and sends a payment receipt back to the student.
